Wire end should protrude to prevent 'kinking' wire inside.

Best:
Cast solid thimbles in bronze - drill pin hole. Find a foundry that will help you. Make a 'pattern' from soft wood, first.

Nicopress users beware!
Even 'heavy duty' thimbles will deform slightly under load causing a sharper radius under the pin which leads to premature failure of the wire here, in a hard-to-see place.

Nicopress terminals used on rigging need extra support for the thimble or special thimbles to prevent 'kinking' under load. Here are two easy methods.

Easiest:
Fit a bushing inside the thimble - size for close fit. Make from bronze or stainless. Length to fit turnbuckle jaw.
